BBSphere

The challenge: the Bloomberg black box

Bloomberg data is familiar, integrated everywhere and business-critical – and nobody can say who is using what.

The same content is ordered again and again, consumers show up that nobody ever registered, and the invoice only moves one way.

BBSphere stops you from paying twice for data you already have. It centralizes requests, answers them from your own store and books every order to its consumer.

Three core objectives

Cut costs

The same content is never ordered twice; repeats come from your own store.

Standardize

One model harmonizes back-office and Per Security content. Add new fields flexibly.

Allocate costs

Usage and cost go to the consumer who caused them – the basis for fair budget control.

Build your own history

Let BBSphere build your own data warehouse which serves all consumers at the right point in time.

Spend less, control more

Cost

No duplicate requests, no double billing.

Data warehouse

Service requests today and tomorrow without re-requesting data.

Transparency

Usage and cost down to user and application level.

Model extension

Centrally extend the model with new fields in the GUI.

Governance

Consumer policies and limits keep budgets in check and compliance provable.

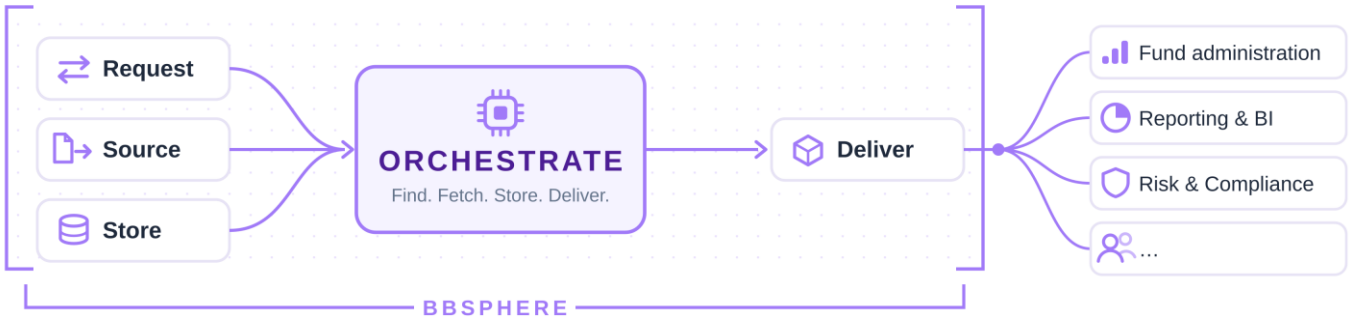
Low-impact integration

Only minor interface changes necessary.

UNITEK ENGINEERING

BBSphere

Architecture: a control layer in front of Bloomberg Data License



What BBSphere offers

Integration & standardization
Back-office and Per Security data in one central model; corrections automated, new fields in the GUI.

Request centralization
Historical content comes from your own store.

Transparency & governance
Analytics on usage, down to consumer and application.

Preemptive checks
Limits and rules per consumer, applied before an external request goes out.

Runs in front of your interfaces
A central instance in front of Data License that speaks your existing formats.

Test at no cost
BBSphere can act as a test data source for your application tests.

Optional modules

CorpX	Splits, dividends and other corporate actions processed automatically.
CalcSphere	Key figures such as duration and yield computed centrally, in one consistent logic.
Allocator	Usage-based cost allocation and hard limits, for budgets that hold.
Self-service	Transparency for end consumers, less support effort and faster provisioning.

Let's talk about bringing your Bloomberg costs under control
